

SAMTEST Case Study- WAN Testing

Trouble-shooting mission-critical cloud-interconnects

A retail company which had deployed its business applications in public cloud wanted to ensure that connectivity to the cloud application infrastructure was monitored and tested frequently to ensure high application performance.

Challenges:

- Hand-held 10/25G testers were ineffective in determining many performance issues, while tools from industry leading vendors are expensive and difficult to operate
- Testing from remote branch locations require additional investment in dedicated test tools for each location

Veryx SAMTEST with virtual test probes provided automated tests that are flexible to easily deploy in any office location.

Outcomes:

- SAMTEST highly simplified testing with built-in zero touch automation capabilities with software-based virtual probes
- Time taken for RCA (root-cause analysis) and trouble-shooting reduced with better quality of diagnosis

“SAMTEST is a highly versatile testing solution that enabled us to ensure that we monitor and comprehensively test our WAN connectivity to the cloud. It can be easily deployed from any of our sites with ease.”

– IT Director
